

Myopia Management Clinic | Ortho-Keratology (Ortho-K) Consent to Treatment

Ortho-K has been recommended for your child due to their progressive myopia. Some important information about compliance and consent are listed below.

Ortho-K lenses are worn overnight and removed in the morning. They temporarily reshape the corneas while your child sleeps. This altered shape corrects their myopia so that prescription glasses and normal daytime contact lenses do not need to be worn during the day. Some adaptation is required during the first few weeks of lens wear and there is a small chance of an eye infection with Ortho-K lenses. However, this risk is very low (less than 1 case per 500 years of wear). Scientific evidence suggests that Ortho-K in children can slow down the rate of progression of their myopia by approximately 50%.

Compliance

For Ortho-K to be safe and myopia management to be effective, your child needs to use the treatment as recommended by your Optometrist. This includes proper hygiene when handling & cleaning contact lenses, regular replacement of Ortho-K lenses (at least once per year) and adhering to the in-office follow-up schedule.

Consent

Please note: all contact lenses used by Maple Ridge Eye Care for Ortho-K are approved by Health Canada for corneal reshaping. However, they have not specifically been approved to slow the progression of myopia, so their use is considered “off-label”. Current scientific evidence has shown this off-label usage to be very effective at managing myopia progression. Detailed scientific research can be provided to you upon request.

I understand the risks as indicated above. Though success in slowing myopia progression is highly likely with Ortho-K, I understand that there is no guarantee of any treatment outcome for my child. At times treatment strategies may be altered or added to achieve the desired results.
